The experience we all got after finishing the demo for our database project wasn't actually that easy as we first thought it would be. Constantly tons of bugs and lack of solutions on StackOverflow make themselves felt.

First we had a completely different idea. We were about to make a course satisfaction rate database. Some kind of site with statistics about student's activity, ratings, count of refunds and so on. But then due to some reasons we changed our direction towards more complex and useful data solutions and made what we made - trendy and popular courses tracker.

Moreover we have changed a couple of different technologies due to the same bugs. It wasn't easy but so cool when it finally worked!

I am more than sure that the experience we gained with this project will be very helpful in future. The work done can become a really useful and relevant tool in the right hands. We have developed a service that regulates the flow of users and analyzes it well. CRM (Customer Relationship Management) may seem like an analogue of our tool, but our product is a narrower tool for analysis, forecasting and management.
